GDPR Article 33: Breach Notification

Obligation ID: DL-001
Status: Final

Notice deadline: 16 July 2026 at 07:35 UTC (08:35 WAT)

Clock basis: GDPR Article 33, starting from 13 July 2026 at 07:35 UTC (08:35 WAT).

1. Nature of the breach

An unauthorized actor accessed the support database and obtained a data export, together with an application service credential that could decrypt certain fields during normal operation. This remains the current assessment and is subject to the ongoing investigation.

The actor has not been identified, so no attribution is being made in this notice.

The personal data involved includes contact details and, for some records, diagnosis-category and identifier information. The extent of the information that could be read depends on the current encryption-key assessment, which is encryption_key_acquired=True.

Population affected: 620 individuals have been confirmed as affected. A further 85 individuals are still under investigation and have not yet been confirmed, giving an upper bound of 705.

I am submitting this notification within the statutory timeframe based on the facts currently confirmed. I am using a phased approach rather than delaying the notification while the remaining figures are reconciled.

A supplementary update will be provided once the pending backup-index reconciliation is complete.

2. Contact point

dpo@example.invalid (Data Protection Officer)

3. Likely consequences

Individuals whose account credentials were exposed face a residual risk of phishing and attempts to access their accounts using those credentials.

Where diagnosis-category or identifier information is confirmed to be readable, the potential impact is higher for that subset.

The passwords themselves are protected using the Argon2id hashing algorithm, and there is currently no evidence that the original password values can be directly recovered.

4. Measures taken or proposed

Containment of the incident has been completed.

Further remediation measures, including credential rotation and enhanced monitoring, are proposed.
